

## Edgefolding

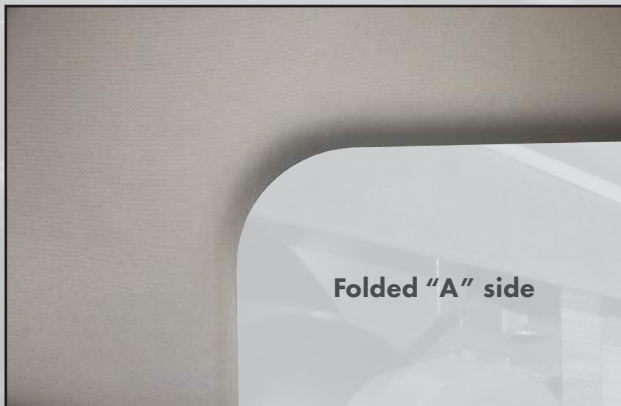

Edgefold machines fold fabric and substrate around a sunroof opening or perimeter edges of the headliner to create a finished edge suitable for the interior of a vehicle. They also can apply a stiffener ring around the sunroof opening that provides support to the headliner as well as mounting locations for fitting the headliner in the vehicle. The stiffener is attached to the headliner with adhesive that is applied to the headliner by the six-axis robot. Koops offers this machine with a tool pack design that allows the product specific tooling to be easily removed so that the machine can run multiple product versions. This enables higher utilization of the capital portion of the machine.

### Features and Benefits

- Edgefolding produces a crisp edge on a rough-cut product
- Multiple versions in one machine with quick change tooling
- Edgefolding of interior openings and perimeter geometry
- Options for integrated component assembly
- Tailored to your specific product makeup (thermoform or thermoset)
